

# ProSelect®

## Raptor III

100% Festuca arundinacea

## Description

Prize-winning turf for top performance The mighty ProSelect® Raptor III fought off stiff competition in recent NTEP trials: it was rated top for mean turf quality. This lovely dark green, dense growing tall fescue is resistant to disease, especially to brown patch. Quite simply a winner.

## Benefits

- \\ Disease-resistant
- \\ High scores from NTEP
- \\ Good deep green color

## How to use

Establishment and maintenance: For best results, seed at 30 – 50gr/m<sup>2</sup> with a high-quality, starter fertilizer in early autumn or spring. It's best to keep the seedbed moist throughout germination and establishment. Germination should begin within 8 – 14 days with optimal temperatures (15° – 26°C). Ensure it has reached approximately 5cm before cutting for the first time. Established turf maintenance: Looks especially good when fertilized annually with nitrogen at 20 – 25gr/m<sup>2</sup>. Water deeply and infrequently for a deep and healthy root system. We recommend a cutting height of 3 – 8cm. If you need more

## Attention

Trial first on a small scale before changing the rate, application, or any other variables. As circumstances can differ and as the application of our products is beyond our control, ICL cannot be held responsible for any adverse results. Contact your ICL advisor for more detailed advice.
